

ENDOFINE® SI SEED TREATMENT

Reducing Environmental Stress In Plants By Working With Mother Nature

EndoFine SI seed treatment is a naturally occurring beneficial fungal inoculant that colonizes plant tissue and establishes a symbiotic relationship and a reduction of environmental stress in a variety of crops

EndoFine SI® Seed treatment is a naturally occurring, beneficial, fungal seed inoculant. The organism is present in all fields but in insufficient numbers to effectively colonize plants. EndoFine can benefit plants in several ways:

- it establishes a normal relationship with plant roots
- it reduces environmental stresses that can create conditions for diseases such as Pythium, Fusarium and Rhizoctonia
- it allows for greater growth and yield potential

Foliar Inoculant:

- improved germination
- faster emergence
- larger root mass
- improved nutrient uptake
- compatible with beneficial bacteria and fungi
- compatible with some chemical fungicides
- low use rates on crops
- cost effective
